Subject: Hold the two Billing hires for a quarter and fix the routing first

Bottom line. Billing looks like the biggest queue only because the chat bot parks delivery problems there. Re-read ticket by ticket, **Logistics is the largest team (29% of tickets, not 16%) and Billing is 18%, not 22%.** I would not sign off two Billing hires on this data.

What I found (18 months, Jan 2025 - Jun 2026)

- **44% of tickets routed to Billing are not billing problems** (1,060 of 2,425). 941 are "I paid but it hasn't arrived" (Logistics work) and 115 are refund-status or pickup chases (Returns Desk). The bot sees "paid" and tags Billing.
- **Those tickets are where the pain is:** median 48 hours to resolve vs 0.8 hours for real billing tickets; 34% miss the first-response target vs 9% (each costs a Rs 350 credit); CSAT 2.4 vs 3.5; and each is handed off about 0.8 times vs 0.1.
- **Neha is right that Logistics is stretched, but it is hidden.** Logistics agents resolved 795 tickets that were tagged Billing. Tickets owned per agent-week (Jan-Jun 2026): Logistics 9.7, Billing 7.9, Returns 5.6, Email 3.3, Voice 3.2, Chat 2.7. Escalations & Warranty is left out: its cases are multi-touch and not comparable on volume.
- **The "Other" tag (14% of tickets) is a dumping ground:** 70% of it is cancellations, address changes, coupon problems and failed payments.

Goal, as a number. Cut non-Billing tickets in the Billing queue from **44% to 10%** within one quarter of changing the bot. That is about 140 fewer wrong-queue tickets a quarter, worth roughly **Rs 45,000 a quarter** on the export's volume (Rs 317 per ticket in avoided hand-offs, SLA credits and repeat contacts), or about **Rs 1.6 lakh a quarter** if true volume is the 650 a week I was quoted. On its own that does not repay two hires (Rs 9 lakh a year). The real value is that the hiring decision then rests on true queue sizes.

What I would do. (1) Ask Sameer to change the bot: "paid/deducted + not delivered" goes to Logistics, and add Cancellation, Address change and Coupon categories to replace "Other". (2) Re-run this tool in 30 days (one command). (3) If Logistics still runs hot, hire there first. (4) Stop charging SLA breaches to the resolving agent on misrouted tickets; Logistics agents currently carry Billing's breaches.

Where I changed your ask. You asked for charts by category and team. I give both as tagged and as re-read, because they give different answers. I did not use "most volume" as the hiring test: volume is not capacity, and no team is clearly short of hands on these numbers.

How far to trust this. Categories come from re-reading the ticket text. I checked about 220 tickets by hand: roughly 1 in 100 wrong on a fresh sample, mostly ambiguous hardware cases ("won't turn on after an update"). I wrote both the tool and the check, so please have Neha's team relabel 100 tickets to confirm. The export averages **181 tickets a week, not ~650**; if it is a sample, the rupee figures scale but the percentages hold. Please confirm. I corrected the Freshdesk timestamps (UTC vs IST). I found no duplicate imports or refund-unit problems. Two tickets got both refund and replacement (Rs 7,249 total), so that is not a lever.

Charts: results/charts/ (routed vs real share; monthly by category; monthly by team).
